Publication No. US20040031072A1

GENERAL INFORMATION:

GENERAL INFORMATION:

APPLICANT: Kovalic David K

APPLICANT: APPLICANT: Acao Yongway Nucleic Acid Molecules and Other Molecules Associated With TITLE OF INVENTION: Plants and Uses Thereof for Plant Improvement

TITLE OF INVENTION: Plants and Uses Thereof for Plant Improvement

TITLE OF INVENTION NUMBER: US/10/424,599

CURRENT APPLICANTION NUMBER: US/10/424,599

CURRENT FILING DATE: 2003-04-28

NUMBER OF SEQ ID NOS: 285684

GENERAL INFORMATION:

APPLICANT: The Government of the United
APPLICANT: States of America as represented by the
APPLICANT: Secretary, Department of Health and Human
APPLICANT: Services, Callahan, Robert, Marchetti,
APPLICANT: Antonio; Buttitta, Fiamma; Smith, Gilbert H.
TITLE OF INVENTION: Nucleotide And Deduced
TITLE OF INVENTION: Int6, And the Use Of Reagents Derived From
TITLE OF INVENTION: These Sequences In Diagnostic Assays,
TITLE OF INVENTION: Vaccines, Immunotherapy And Gene Therapy
CORRESPONDENCE ADDRESS:
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                             ATTORNEY/AGENT INFORMATION:

APPLICANT: States of America as represented by the
APPLICANT: Secretary, Department of Health and Human
APPLICANT: Services; Callahan, Robert; Marchetti,
APPLICANT: Antonio; Buttitta, Fiamma; Smith, Gilbert H.

TITLE OF INVENTION: Nucleotide And Deduced
TITLE OF INVENTION: These Sequences Of Reagents Derived From
TITLE OF INVENTION: These Sequences In Diagnostic Assays,
TITLE OF INVENTION: Vaccines, Immunotherapy And Gene Therapy
NUMBER OF SEQUENCES. 32

CORRESPONDENCE ADDRESS:
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                    ;

Sequence 10190, Application US/09949016 Patent No. 6812339 Patent INFORMATION: APPLICANT: VENTER, J. Craig et al.

```
TITLE OF INVENTION: POLYMORPHISMS IN KNOWN GENES ASSOCIATED
TITLE OF INVENTION: WITH HUMAN DISEASE, METHODS OF DETECTION AND USES THEREOF
FILE REPERENCE: CL001307
CURRENT APPLICATION NUMBER: US/09/949,016
CURRENT FILING DATE: 2000-04-14
PRIOR APPLICATION NUMBER: 60/241,755
PRIOR FILING DATE: 2000-10-20
PRIOR PRIOR APPLICATION NUMBER: 60/237,768
PRIOR FILING DATE: 2000-10-03
PRIOR FILING DATE: 2000-10-03
PRIOR FILING DATE: 2000-0-09-08
NUMBER OF SEQ ID NOS: 207012
SOFTWARE: FREESEQ for Windows Version 4.0

US-09-270-767-50837

US-09-270-767-50837

Sequence 50837, Application US/09270767

Patent No. 6703491

GENERAL INFORMATION:

TITLE OF INVENTION: Nucleic acids and proteins of Drosophila melanogaster

TITLE OF INVENTION: Nucleic acids and proteins of Drosophila melanogaster

CURRENT PELICATION NUMBER: US/09/270,767

CURRENT PILING DATE: 1999-03-17

NUMBER OF SEQ ID NOS: 62517

SOFTWARE: PatentIN Ver. 2.0

SEQ ID NO 50837

LENGTH: 55
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                   ö
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                              ö

                                                                                                                                                                                                                   chromosome 15 of a mouse genome. The Inte gene is associated with MMTV (mouse mammary tumour virus) integration into a host genome during tumourigenesis. Primers and probes may be derived from the Inte gene sequence and used for detection in assays to diagnose MMTV infection, or any other Inte gene integration. Antibodies against the Inte protein can be used in the same way. The DNA and protein may also be used gene

                                                                                                                                                                                                                                                                                              AAW02112 represents the human homologue of murine Int6 protein. The Int6 gene is located at chromosome 15 of the mouse genome and is associated with MMTV (mouse mammary tumour virus) integration into a host genome during tumourigenesis. Primers and probes may be derived from the INt6 CDNA sequence and used for the detection of the Int6 gene. These can be used in assays to diagnose MMTV infection, or any other Int6 gene integration. Antibodies against the Int6 protein can be used in the same

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                            This sequence shows murine Int6. Int6 is an integration site for mouse mammary tumour virus (MMTV), which causes deregulation of expression of cellular genes adjacent to the site of MMTV integration in mammary tumours. The Int6 protein has been found to be highly conserved across species, with Drosophila Int6 being 60% identical to human/mouse Int6. This indicates that Int6 is serving a basic life function. The method of the invention comprises assaying a sample to detect a human Int6 nucleic acid sequence, or its fragment, by contacting the sample with a sequence of at least 15 consecutive nucleotides of human Int6 cDNA or a
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                              conservative variant of it, where a disrupted expression or loss of expression of the variant is associated with neoplasia. The method is useful for prenatal screening of a foetus or to pre-symptomatically screen a subject at risk of having cancer. Detecting mutations in the Inté gene can provide diagnostic and prognostic information. The nucleic acids and proteins are useful in immunotherapy, gene therapy or as

into sequence shows the main into contains sequence was included by using murine Into into into contains a CA-repeat in the forganised into 13 exons as is murine Into, and contains a CA-repeat in the 7th intron. Human Int6 has been localised to chromsome 8, more pecifically to 8q22-q24. Int6 is an integration stee for mouse manmary tumour virus (MMTV), which causes deregulation of expression of cellular genes adjacent to the site of MMTV integration in mammary tumours. The Int6 protein has been found to be highly conserved across species, with prosophila Int6 being 60% identical to human/mouse Int6. This indicates that Int6 is serving a basic life function. The method of the invention comprises assaying a sample to detect a human Int6 nucleic acid sequence, or its fragment, by contacting the sample with a sequence of at least 15 consecutive nucleotides of human Int6 cDNA or a conservative variant is associated with neoplasia. The method is useful for prenatal screening of a foetus or to pre-symptomatically screen a subject at risk of having cancer. Detecting mutations in the Int6 gene can provide diagnostic and proteins are useful as probes for isolating homologues of Int6 gene or for detecting mutations in the Int6 gene in the Int6 gene or for detecting mutations in the Int6 gene.
from them in cancer gene therapy, vaccines, diagnosis and immunotherapy.
                                                                                                                        sequence shows human Int6. The human Int6 coding sequence

Human expressed protein tag (EPT) #1833.

Translational profiling; expressed protein tag; EPT; kinase; phosphatase; protease; protease inhibitor; transporter; cytoskeletal protein;

fragment of a kinase, phosphatase, protease, which comprises a fragment of a kinase, phosphatase, protease, protease inhibitor, transporter, cytoskeletal protein, receptor or transcription factor. The polypeptide is useful as an immunogenic composition for eliciting in a mammal an immunogenic response directed against any of the purified polypeptide, or the antibody that binds to this polypeptide. The purified polypeptide, or the antibody that binds to this polypeptide, is useful for treating cancer. The polypeptide is also useful for identifying compounds that binds to a naturally processed class I or class II MHC-binding polypeptide. The polypeptides and polymenticledides are particularly useful for treating or preventing myeloma, colon cancer, gastric cancer, adenocarcinoma, sarcoma, melanoma, lymphoma or leukaemia. These are also useful for screening agents for treating the above mentioned diseases. This sequence represents an expressed protein tag (BFT) isolated from human tissue for translational profiling. Note: This sequence does not appear in the printed promitived specification but was obtained in electronic format directly from WIPO at 180 120 New polypeptides (e.g. kinases, phosphatases, proteases, transporters, cytoskeletal proteins, receptors or transcription factors), useful for treating cancer, e.g. colon cancer, gastric cancer, sarcoma, lymphoma or 9 receptor; transcription factor; cancer; WHC; major histocompatability complex; myeloma; colon cancer; gastric cancer; adenocarcinoma; sarcoma; melanoma; lymphoma; leukaemia.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                      The invention describes a purified polypeptide, which comprises a fragment of a kinase, phosphatase, protease, inhibitor, transporter, cytoskeletal protein, receptor or transcription factor. The polypeptide is useful as an immunogenic composition for eliciting in a mamunogenic response directed against any of the purified polypeptide, or the antibody that binds to this polypeptide, is useful for treating cancer. The polypeptide is also useful for identifying compounds that binds to a naturally processed class I or class II MHC-binding polypeptide. The polypeptides and particularly useful for treating or preventing myeloma, colon cancer, gastric cancer, adenocarcinoma, accome, melanoma, lymphoma or leukaemia. These are also useful for screening agents for treating the above mentioned diseases. This sequence represents an expressed protein tag (BFP) isolated from human tissue for translational profiling. Note: This sequence does not appear in the printed profiling. Note: This sequence does not appear in the printed profiling the above mentioned in electronic format directly from WIPO at

PT New polypeptides (e.g. kinases, phosphatases, proteases, transporters, cytoskeletal proteins, receptors or transcription factors), useful for treating cancer, e.g. colon cancer, gastric cancer, sarcoma, lymphoma or leukemia.

XX

Example 2; SEQ ID NO 1824; 134pp; English.

XX

CC fragment of a kinase, phosphatase, protease inhibitor.

Cragment of a kinase, phosphatase, protease inhibitor.

Cransporter, cytoskeletal protein, receptor or transcription factor.

Cransporter, cytoskeletal protein, receptor or transcription for eliciting in a mammagenic response directed against any of the purified polypeptide, is useful for treating cancer. The polypeptide is also polypeptide, is useful for treating cancer. The polypeptide is also cuseful for identifying compounds that binds to a naturally processed class I or class I MHC-binding polypeptide. The polypeptides and polymbled are particularly useful for treating or preventing myeloma, colon cancer, gastric cancer, adenocarcinoma, sarcoma, melanoma, lymphoma or leukaemia. These are also useful for screening agents for treating the above mentioned diseases. This sequence represents an confiling. Note: This sequence does not appear in the printed profiling. Note: This sequence does not appear in the printed from WIPO at Etp.wipo.int/pub/published_pct_sequences

This invention relates to novel mitochondrial targets that can be used for therapeutic intervention in treating a disease associated with altered mitochondrial function. Specifically, it refers to a method for identifying proteins of the human heart mitochondrial proteome that are useful for drug screening assays, as well as therapeutic targets. The present invention describes a method for identifying such proteins that can be used in the treatment of various disease associated with altered mitochondrial function including diabetes mellitus, Huntington's disease, osteoarthritis, Leber's hereditary optic neuropathy (LHON), mitochondrial corephalopathy lactic acidosis and stroke (MELAS), myoclonic epilepsy ragged red fibre syndrome (MERRP) or cancer. Accordingly, these compositions have neuroprotective, nootropic, antidiabetic, anticonvulsant, antiarthritic, osteopathic, ophthalmological and cytostatic activities. This polypepide sequence is a human heart mitochondrial protein of the invention.
                myoclonic epilepsy ragged red fibre syndrome; MERRF; cancer; neuroprotective; nootropic; antidiabetic; anticonvulsant; antiarthritic; osteopathic; ophthalmological; cytostatic.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                 Identifying a mitochondrial target for drug screening assays and for treating diseases associated with altered mitochondrial function, comprises detecting a modified polypeptide in a sample and correlating with the disease.
                                                                                                                                                                                                                                                                                                                                                                                          ξ

The int6 protein deregulates mammary epithelial cellular growth. The cDNA and protein are useful as vaccines for treating cancer. This sequence represents the murine Int6 protein of the invention.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                               CISINMLADKLINMTPBEAERWIVNLIRNARLDAKIDSKLGHVVMGNNAVSPYQQVIEKTK 360

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                           셤
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                ö
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                           The invention relates to the Int6 protein and the cDNA encoding it. The Int6 protein deregulates mammary epithelial cellular growth. The cDNA and protein are useful as vaccines for treating cancer. This sequence represents the human Int6 protein of the invention.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                180

The present invention describes a method for examining ischaemic conditions, comprising measuring the expression levels of particular genes (I) in a test sample or determining the expression profile of a gene group in the sample or determining the expression profile of a schaemia, occlusive ischaemia or vasospassion (e.g. compressive ischaemia, occlusive ischaemia or vasospassic by measuring expression levels of particular genes (AB199202 to AB199912, encoding the protein sequences in ABB57020 to ABB57374) or by determining the protein sequences in ABB57020 to ABB57374) or by determining the protein sequences in profiles produced by these genes are used as an indicator when screening for ischaemic condition-improving drugs or indicator when screening for ischaemic diseases. AB199913 and AB199914 represent PCR primers for a mouse ischaemic condition related sequence, which are used in the exemplification of the present invention

The polynucleotides are expressed in prostate and are useful as molecular markers, as drug targets, and for detecting, monitoring, preventing or treating diseases and conditions related to prostate, such as prostate cancers. The present sequence represents a prostate specific polypeptide

The invention describes a purified polypeptide, which comprises a fragment of a kinase, phosphatase, protease, protease inhibitor, transporter, cytoskeletal protein, receptor or transcription factor. The polypeptide is useful as an immunogenic composition for eliciting in a mammal an immunogenic response directed against any of the purified polypeptide, or the antibody that binds to this purified polypeptide, or the antibody that binds to this polypeptide, is useful for treating cancer. The polypeptide is also useful for identifying compounds that binds to a naturally processed class I or class II MHC-binding polypeptide. The polypeptides and polymucleotides are particularly useful for treating or preventing compounds cancer, adenocarcinoma, sarcoma, melanoma, lymphoma or leukaemia. These are also useful for screening agents for treating the above mentioned diseases. This sequence represents an profilling. Note: This sequence does not appear in the printed specification but was obtained in electronic format directly from WIPO at ftp. wipo.int/pub/published_pct_sequences
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                     109

myeloma, colon cancer, gastric cancer, adenocarcinoma, sarcoma, melanoma, lymphoma or leukaemia. These are also useful for screening agents for treating the above mentioned diseases. This sequence represents an expressed protein tag (BPT) isolated from human tissue for translational specifilms. Note: This sequence does not appear in the printed specification but was obtained in electronic format directly from WIPO at ftp.wipo.int/pub/published_pct_sequences
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                The invention describes a purified polypeptide, which comprises a fragment of a kinase, phosphatase, protease, protease inhibitor, transporter, cyroskeletal protein, receptor or transcription factor. The polypeptide is useful as an immunogenic composition for eliciting in a mammal an immunogenic response directed against any of the purified polypeptide, or the antibody that binds to this polypeptide, is useful for treating cancer. The polypeptide is also useful for treating cancer. The polypeptide is also useful for treating ones. The polypeptide and class I or class II MHC-binding polypeptide. The polypeptides and polymucleotides are particularly useful for treating or preventing

                                                                                                                                                  Š
                                                                                                                                                                                           원
                                                                                                                                                                                                                                                                                                                         The invention describes a purified polypeptide, which comprises a fragment of a kinase, phosphatase, protease, protease inhibitor, transporter, cytoskeletal protein, receptor or transcription factor. The polypeptide is useful as an immunogenic composition for eliciting in a mammal an immunogenic response directed against any of the purified polypeptide. The purified polypeptide, or the antibody that binds to this polypeptide, is useful for treating cancer. The polypeptide is also useful for identifying compounds that binds to a naturally processed class I or class II MHC-binding polypeptide. The polypeptides and polymoleotides are particularly useful for treating or preventing myeloma, colon cancer, gastric cancer, adenocarcinoma, sarcoma, melanoma, lymphoma or leukaemia. These are also useful for screening agents for treating the above mentioned diseases. This sequence represents an treating the above mentioned diseases. This sequence represents an profiling. Note: This sequence does not appear in the printed specification but was obtained in electronic format directly from WIPO at
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                           ö

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                            and mouse cDNA sequences.";

Proc. Natl. Acad. Sci. U.S.A. 99:16899-16903(2002).

-!- FUNCTION: Binds to the 40S ribosome and promotes the binding of methionyl-tRNAi and mRNA.
-!- SUBUNIT: eIF-3 is composed of at least 12 different subunits.
-!- SUBUNIT: eIF-3 is composed of at least 12 different subunits.
-!- SUBCELLULAR LOCATION: Cytoplasmic.
-!- TISSUE SPECIFICITY: Ubiquitously expressed.
-!- DISEASE: Int-6 serves as a site for viral integration of mouse mammary tumor virus (MRTY) in mammary tumors.
-!- SIMILARITY: Belongs to the BIF336 family.
-!- SIMILARITY: Contains 1 PCI domain.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                             GRPEGHRGLRGDPLEGNG (in MMTV-induced
